Many people around here have complained of headaches and severe pains. But most thought it was just the seasonal flu and they didn’t go to hospital.

> **INSECTICIDE**

**Features**

- **Warm-weather fiends**
  - Ticks
  - Mosquitoes
  - Flies
  - Bees and wasps
- **KILLING US SOFTLY**

The tiny mosquito can be deadly and warmer temperatures will see its numbers spreading further.

**Doctor told man’s family to prepare for his funeral**

CITATION: [Tittawar, Srini.]. 2019. The Times of India. 23 March. p.15. In developing countries, mosquitoes are a constant threat. The 2015–2016 Chikungunya outbreak in Asia is a reminder of this.ilation. Attacks by mosquitoes have been frequent in the region, with many people losing their lives to the disease. The disease is spread by mosquitoes that breed in stagnant water, such as ponds, rice fields, and other bodies of water. The disease can be prevented by controlling the breeding of mosquitoes, and this can be done by controlling the temperature and humidity in the environment. The disease can also be prevented by using insect repellents and wearing protective clothing.

**Warm-weather fiends**

- Mosquitoes are not the only disease-transmitting agents that are spreading due to the effects of climate change.

**BATS**

- In Australia, large fruit bats have been found to be spreading the virus to humans. These bats are known to carry the virus, and their droppings can spread the virus to other animals and humans.

**VIRUS BACTERIA**

- See temperatures rising because of climate change. This has led to an increase in the number of mosquitoes, which can carry diseases such as dengue fever and malaria.

**CONTAMINATED FISH**

- If you are a fisherman and have a coal mine, and people should pay attention to the potential for these diseases. The spread of these bacteria is a significant problem, as they can cause serious illness and even death.

**INSIGHT**

- A baby in Brazil born with microcephaly. Zika infections have been linked to microcephaly, where affected babies have abnormally small heads and may develop conditions such as intellectual disability and hearing loss.

**INSIGHT**

- The spread of these bacteria is a significant problem, as they can cause serious illness and even death.

**INSIGHT**

- People believe that sleeping under mosquito nets can help prevent dengue, but they do not know that the Aedes mosquitoes bite during the day.

**INSIGHT**

- The silver lining is that the disease is spreading at a slower rate, and the spread of these bacteria is slowing down.

**INSIGHT**

- The spread of these bacteria is a significant problem, as they can cause serious illness and even death.

**INSIGHT**

- The spread of these bacteria is a significant problem, as they can cause serious illness and even death.
